@disruptivedean

# **About Disruptive Analysis**

- London-based analyst house & strategic consulting firm
- Covers mobile, voice, service provider technology
- Cross-silo, contrarian, visionary, independent
- Advisor to telcos, vendors, regulators & investors
- Covering VoIP since 1997 & WebRTC since June 2011
- Published report on "Telco-OTT Strategies", Feb 2012
- \*\*New\*\* Report on WebRTC, Published Feb 2013
  <u>http://disruptive-analysis.com/webrtc.htm</u>

*Twitter @disruptivedean Blog: disruptivewireless.blogspot.com* 

# Why do people make phone calls, anyway?

# Only a slight exaggeration:

### Phone calls are 130 years old

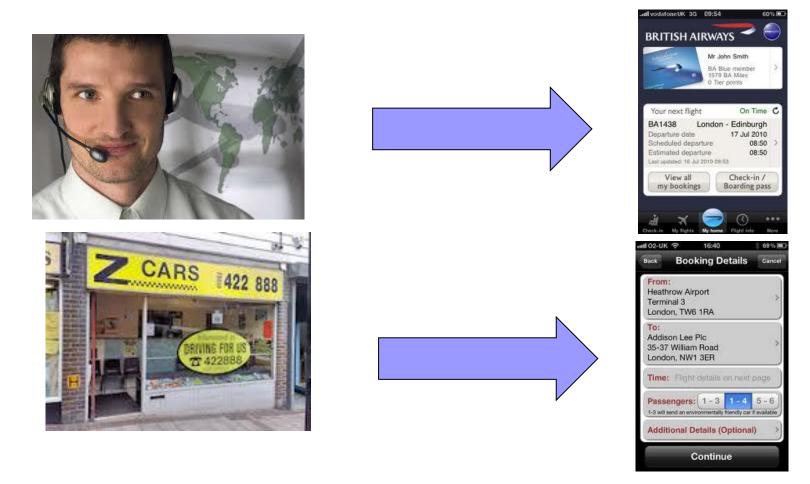

### Jack-of-all-trades, but master of none

### Poor fit with real human behaviour

# WebRTC & mobile apps enable better, but more fragmented communications modes

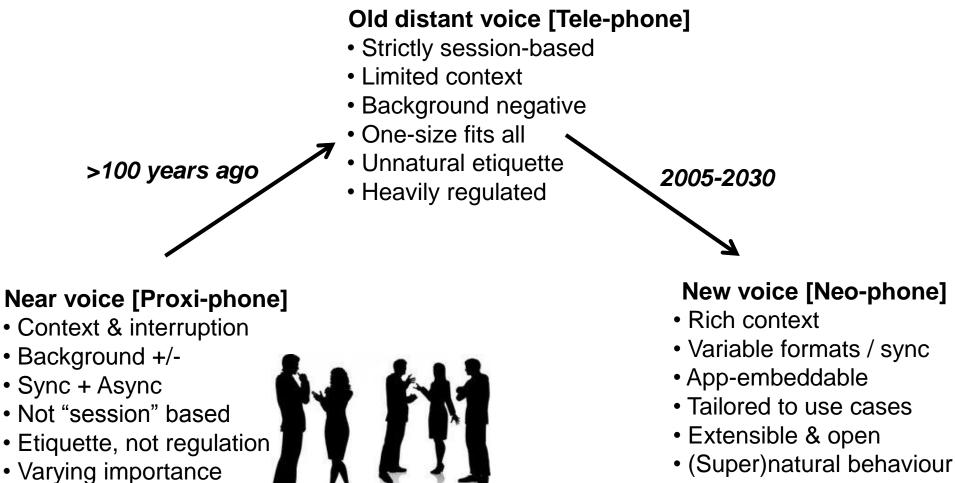

# Not just Skype & SIP that are impacting voice

# Evolving the tele-phone [distant voice]

• Regulation?

Apr 2013

Natural

# Voice ≠ Telephony

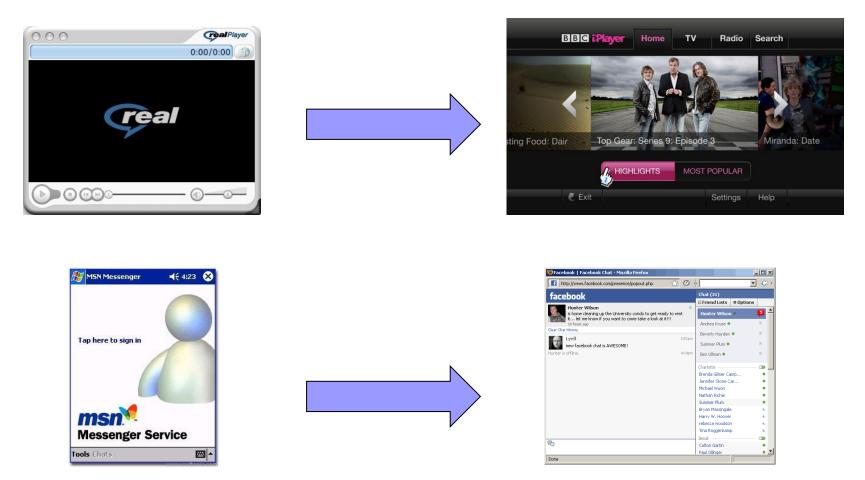

### Past: 2G / 3G / PSTN / UC

### Future: WebRTC, apps, APIs, 4G

### Remember these? Video & IM move to web

#### Many previous "standalone" functions are now integrated with web pages

# Coming next: voice, video, data in browser

(Yes, you can sort-of do it with plug-ins and Flash already.... But it's not very good)

Concept: a simple set of Javascript APIs so web devs can use it without fuss Complexities of codecs, media engine, firewall traversal etc all "sorted"

# Voice/video moving from service to function

# For telcos, it's all looking pretty grim anyway Downsides

### Voice & SMS saturation & cannibalisation Regulation & competitive impacts Weak content & VAS propositions Economic pressures Ecosystem competition

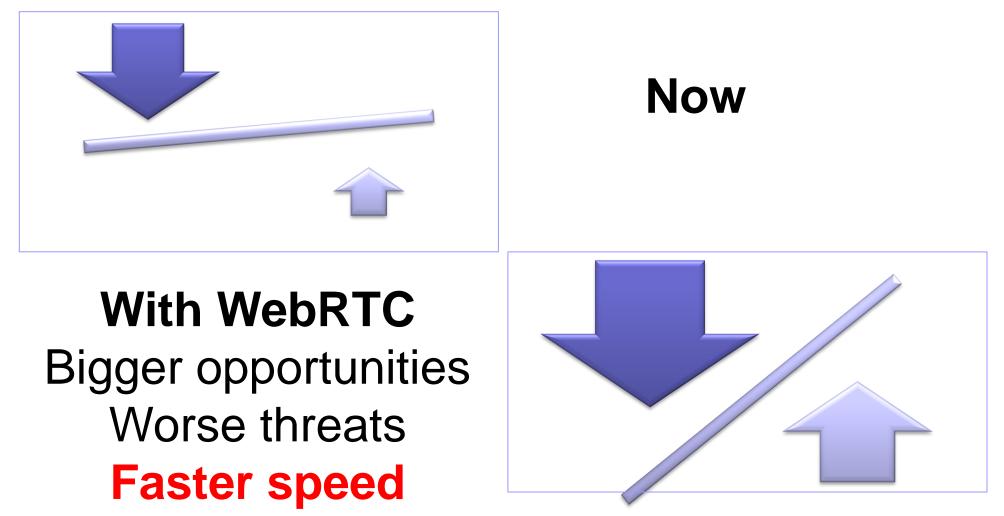

### Upsides

Connecting the last unconnected Smartphones & data growth Better segmentation, pricing & promotion Innovative services & enablers Embracing & exploiting fragmentation

# For telcos WebRTC is really a magnifier/catalyst

# WebRTC implementation: fixed & mobile

Most WebRTC on PCs will be "inside the browser"

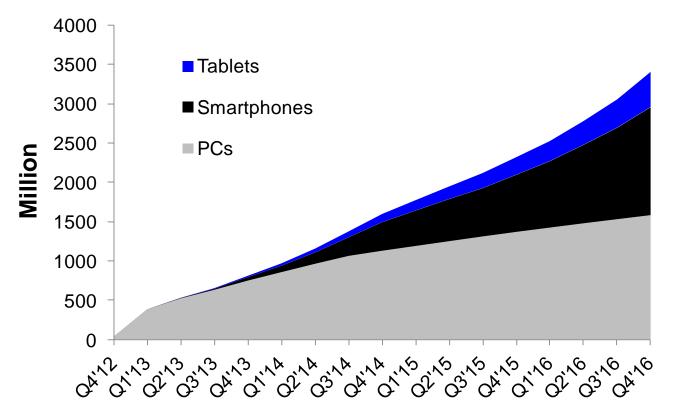

On mobile, it's much more complicated

#### WebRTC is one area that is definitely not "mobile-first". PCs about 18 months ahead

# Device base supporting WebRTC

Source: Disruptive Analysis WebRTC Strategy Report, Feb 2013 Definitions & methodology in report - See disruptivewireless.blogspot.com for details

WebRTC base will grow rapidly, catalysed by auto-updated Chrome & Firefox browsers

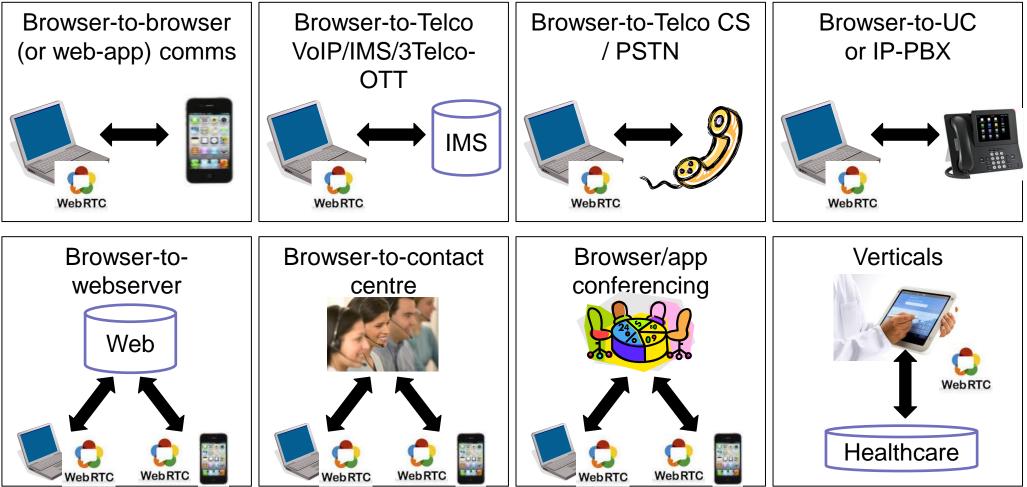

# WebRTC? But we've had VoIP apps for years!

- Hard-phone VoIP slowly fading
- Most VoIP apps are standalone "calling" tools
- Contextual / in-app opportunity slow & fragmented
- Complexity for developers
  - □ Rocket-science for SIP, acoustics etc
  - □ "Telephony" model inflexible
- WebRTC fit with HTML5/apps should enable "beyond the call" voice
- Similar to Flash video replacing Real for in-browser streaming
- Plus cool new stuff like realtime data
- Mashups + comms may shift shape of the curve

# WebRTC key use cases

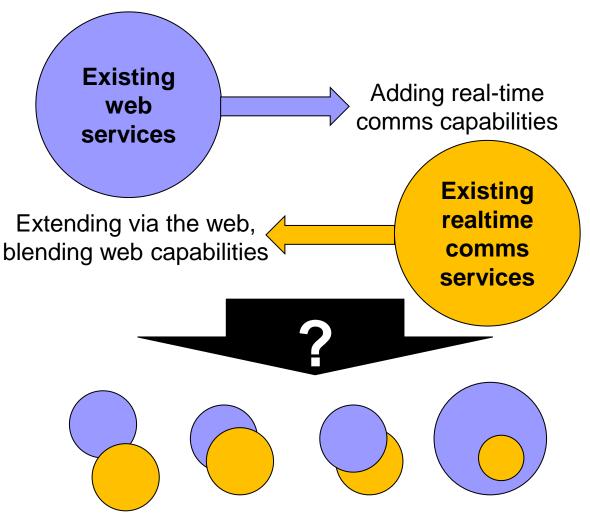

Plus: M2M, gaming, TV-based, data-centric & various others

Copyright Disruptive Analysis Ltd 2013

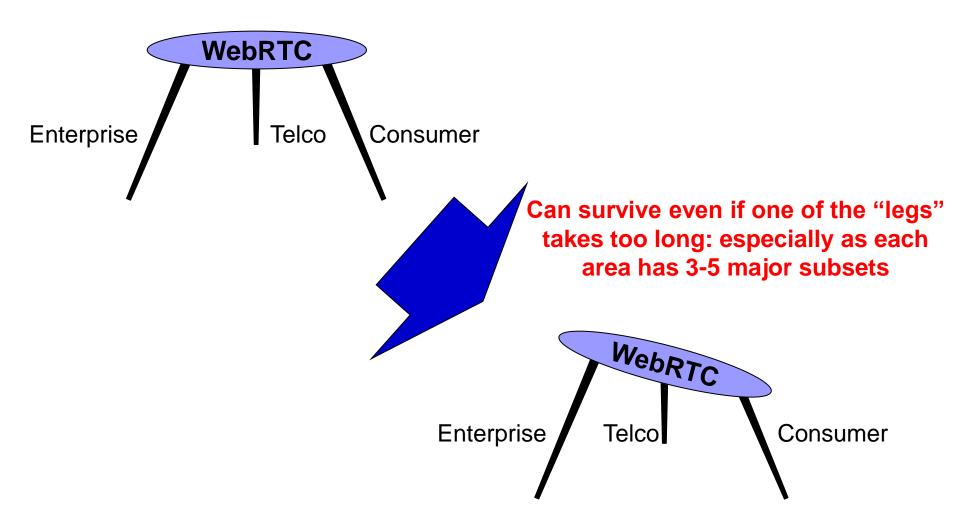

### What use-cases lead?

# WebRTC is a 3-legged (& therefore stable) stool

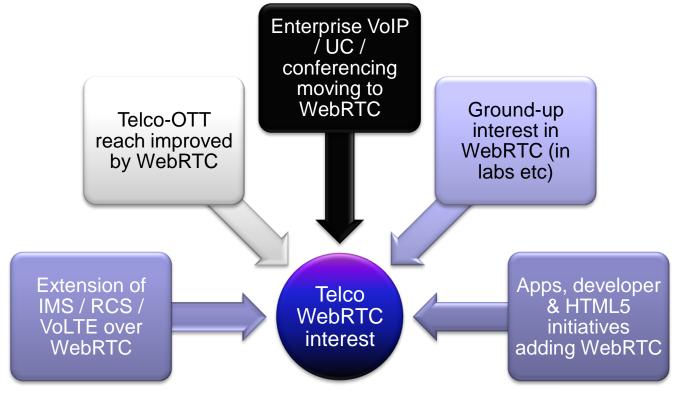

# Enterprise benefits of WebRTC as platform

### Many use-cases & "angles"

- □ Your website becomes your call centre
- □ New models for customer interaction (eg contextual support via video)
- Browser becomes flexible/updateable softphone
- □ Easier federation / interconnect between companies
- Slick web-based conferencing, inc. easier integration with web tools like LinkedIn & DropBox
- □ Easier 2-way comms within mobile apps
- □ Various new possibilities with realtime data sharing
- Don't just think about WebRTC in terms of today's telephony
- Think more adding comms to any company website or app

# Multiple telco angles/oppo's for using WebRTC

+ Policy / broadband teams: Can we detect / block / bill for it? Regulatory: What does this mean, how do we do 911 etc?

IMS extension currently "loudest" Telco/WebRTC domain, but not necessarily most important. Execs should ensure it is exploited across the organisation

Apr 2013

# Will WebRTC enable purpose-specific comms?

|                                    | "Jumping<br>in a cab!<br>There in 5" | 1-hour<br>conference<br>call  | 45 min chat<br>to Aunt in<br>Australia | Unsolicited<br>B2B sales<br>call             | "Wish you<br>were<br>here"            |
|------------------------------------|--------------------------------------|-------------------------------|--|--|---------------------------------------|
| Pre-<br>arranged?                  | No                                   | Yes                           | Maybe                                  | No, but<br>maybe<br>escalated                | Sent as<br>async<br>"postcard"        |
| Video?                             | No                                   | Maybe, with<br>"mute"         | Probably                               | Worse than<br>useless                        | Yes                                   |
| In-app?                            | Maybe in<br>diary or map             | Yes, in conf<br>/ collab tool | Probably not<br>(Family<br>SocNet?)    | Not today.<br>Maybe in<br>future             | Photo app                             |
| Background<br>noise<br>suppression |                                      |                               | Probably<br>quiet place<br>anyway      | Yes, don't<br>want to hear<br>call-ctr noise | Limited, eg<br>waves in<br>background |

# Conclusion

- WebRTC is real and here now
- Still very new but evolving at super-speed
  - Standards issues, mobile & even MS/Apple worked around
- Supported by almost all "big names" from comms & Web
   "Buzz" from incumbents, startups, investors; few dissenters
- Browser support on PCs fairly fast, mobile more patchy
- Multiple use-cases
  - Enterprise
  - Telco
  - Consumer web
  - □ Niche / vertical / disruptive plays
- Use-cases with many "moving parts" will take longer
  - So start now!
